ClickSIP – Click Shoppable Interactive Platform

1. Product Vision
2. Core Features (nothing skipped)
3. System Architecture
4. Database Structure
5. Image + Hotspot Engine
6. Lead Capture System
7. Analytics Engine
8. Embedding & Integrations
9. Admin & Licensing Logic
10. Technical Stack Options
11. Step-by-Step Build Plan

All explained in simple, clear English for developers.

1. Product Vision (What We Are Building)

We are building a **cloud-based SaaS platform** that allows users to:

- Upload an image
- Add clickable interactive hotspots
- Attach:
  - Product links
  - Videos
  - Email forms
  - Phone numbers
  - Descriptions
- Track performance (views, clicks, leads)
- Embed the image on any website

The main goal:

> Turn normal images into interactive, revenue-generating assets.

This is NOT just an image editor.
It is:

- A campaign builder
- A lead generation tool
- A conversion optimization tool
- An analytics platform

2. Complete Feature Breakdown (From Transcript – Nothing Missed)

A. Dashboard

When user logs in:

- Show:
  - Number of domains allowed (e.g., 10 domains license)
  - Total campaigns
  - Analytics overview
- Button:
  - “Add Domain”
  - “Create New Campaign”

B. Domain Management

User must:

- Add domain (e.g., mysite.com)
- System verifies domain
- Save domain to user account

This allows:

- Embedding only on registered domains (security control)

C. Image Upload System

User can:

- Upload image from:
  - Local computer

    - Pixabay integration
    - Designer Pro integration
    - Youzign integration
- After upload:
    - Select domain
    - Click Next
    - Enter Image Editor

D. Image Editor Features

Inside editor:

User can:

1. Add multiple hotspots
2. Enable watermark
3. Enable sound
4. Apply image filters (Instagram-style effects)
5. Resize
6. Enhance image

This requires:

- Canvas-based editor
- Layer system

3. Hotspot System (Core Engine)

This is the heart of the product.

User clicks anywhere on image → hotspot appears.

We must support 9 hotspot types:

1. Standard hotspot (simple click)
2. Text hotspot
3. Image hotspot
4. Image + description
5. Description only
6. Video hotspot

7. Video + CTA
8. Sign-up form
9. Email sign-up with image

Each hotspot must allow:

- Position (X,Y coordinates)
- Size
- Roundness
- Icon selection (600+ icons)
- Background color
- Icon color
- Pulse animation
- CTA text
- Price
- URL
- Email
- Phone
- Open type:
  - On click
  - On hover

4. How Hotspot Works Technically

Each hotspot stores:

```
{
  id,
  image_id,
  type,
  x_position,
  y_position,
  width,
  height,
  icon,
  background_color,
  icon_color,
  title,
  description,
  price,
  cta_text,
  action_type (url/email/phone/video/form),
  action_value,
  trigger_type (click/hover),
  sound_enabled,
  sound_file
}
```

On frontend:

- Image loads
- Hotspots render as absolutely positioned divs
- Click triggers modal or redirect

5. Lead Generation Feature

When hotspot type = Email Sign-up:

System must:

- Show:
  - Name field
  - Email field
- On submit:
  - Save to database
  - Optional redirect URL
- Allow:
  - CSV export
- Future enhancement:

- Webhook integration to autoresponders

Database table:

```
leads:
id
campaign_id
name
email
timestamp
ip_address
```

6. Analytics Engine (Very Important)

We must track:

- Total image views
- Hotspot impressions
- Hotspot clicks
- CTA clicks
- Leads generated
- Conversion rate

How to implement:

When:

- Image loads → count as view
- Hotspot displayed → impression
- Hotspot clicked → click
- Form submitted → lead

Store in:

```
analytics_events:
id
campaign_id
hotspot_id
event_type (view/click/cta/lead)
timestamp
device
browser
referrer
```

Dashboard shows:

- Total views
- Total engagement
- Click-through rate
- Best performing hotspot

7. Embedding System

User must be able to:

- Copy iframe code
- Paste in:
  - WordPress
  - Shopify
  - ClickFunnels
  - Facebook
  - Any HTML site

Iframe example:

```
1
```

Important:

- Must load dynamically
- Must track analytics per domain

8. Sound Feature

Optional feature:

- User selects sound file
- When hotspot is clicked → sound plays

Implementation:

- Audio tag triggered on event

9. Watermark Feature

User can:

- Upload watermark image

- Set:
  - Opacity
  - Position
  - Size

Rendered as overlay layer.

10. Icon Library

We must include:

- 600+ icons
- Categorized
- Searchable
- Stored as SVG
- Color editable

11. Cloud-Based SaaS Architecture

This is not downloadable software.

System must be:

Frontend:

- React or Vue (for drag-drop editor)

Backend:

- Node.js / Laravel / Django

Database:

- PostgreSQL or MySQL

Storage:

- AWS S3 or Cloudflare R2 (for images)

Analytics:

- Internal event tracking API

12. Permissions & Licensing Logic

System must support:

- Plan-based limits:
  - Number of domains

- Number of campaigns
- Number of hotspots
- Number of leads stored

Example:

Free Plan:

- 1 domain
- 5 campaigns

Pro Plan:

- 10 domains
- Unlimited campaigns

13. User Flow (Step-by-Step)

1. User registers
2. Adds domain
3. Uploads image
4. Adds hotspot
5. Configures:
    - Title
    - Price
    - CTA
    - URL
6. Saves campaign
7. Clicks Preview
8. Clicks “Get Embed Code”
9. Pastes iframe into website
10. Visitors interact
11. System tracks analytics

14. Frontend Rendering Logic

When image loads:

1. Fetch campaign JSON

2. Render image
3. Loop hotspots
4. Render each as positioned div
5. Attach event listeners
6. Trigger modal or redirect

Must be:

- Mobile responsive
- Touch-friendly
- Fast loading

15. Performance Requirements

Because this will be embedded:

- Lightweight script (<200kb preferred)
- Lazy loading images
- CDN caching
- Compressed images

16. Security Requirements

- Domain verification required
- API token per campaign
- Prevent embedding on unauthorized domains
- Sanitize URL inputs
- Validate email inputs

17. Monetization Model (For Your Business)

You can charge:

Option 1: Monthly SaaS
Option 2: Lifetime Deal
Option 3: Per Campaign
Option 4: Per 1,000 Views

Since you're building scalable systems (like VemTap), this can become:

- Upsell inside VemTap

- Image engagement tool for restaurants
- Shoppable menu images
- Interactive promo banners

This can integrate beautifully with:

- NFC tap landing pages
- Promo expo
- Business digital catalog

18. What Makes This Powerful

This works because:

People:

- Look at images more than text
- Click visually attractive elements
- Prefer interactive content

This turns:
Passive image → Active conversion tool

Final Product Summary

We are building:

A cloud-based interactive image monetization platform that allows users to:

- Upload images
- Add customizable hotspots
- Add product links, videos, forms
- Capture leads
- Track performance
- Embed anywhere
- Scale via SaaS model
